

If we drop SDIO, we get SPI3 and I2C3
 SPI2 can not be used when we have ethernet
 Maybe use "single lane" SDIO, that is using only D0, CK and CMD.

TODO I2C on header?
 UART on header?

What about Vref for internal ADC?
 Add supply
 SWD programming?
 JTAG (AAUSAT dongle?)
 Fumlepad's temperatur?
 ethernet? nah, ikke nu, måske vi kan trække de relevante pins up på egen header?
 USB protection stuff
 sdcard
 ekstra STACK connector for easy fumlewiring?
